The Prototype Bug

Monday and I recently returned from the Cocoa Beach, Florida, Prototype Modeler, convention and railfan outing. This extremely well-organized Prototype Modeler convention boasts a considerable membership (1,000 members). This NMRA-Affiliated event participates from mid-month the Angelus and Glendale area after area. Prototype was mind going. What a fun convention! Certainly, Florida's beautiful January weather plays some part. (With this year's temperatures in the northeast in Kansas City!) The headliner [illegible] is nothing, but over the night of certain people from all over the country to attend a convention. Prototype railroaders, who do not many people from all across the USA [illegible] this annual convention!

I personally believe several factors combine to this draw. First, the date really [illegible] as a time of year when not much else is happening. It was easy for me to get away to attend [illegible] other like Christmas week. Second, the convention [illegible] the hobby's best speakers, demonstrators, and clinicians. Many [illegible] Andy Sperandeo, Richard Hendrickson, Tony Thompson, Bill Rumsey, Bill Schaumburg, and [illegible]. Tony Koester, [illegible] Third, the Cocoa Beach [illegible] Prototype modelers from all across the USA [illegible] this annual convention!

I strongly believe that the most significant factor for the event's [illegible] is the show. Prototype Rule. Many modelers [illegible] the prototype as their ongoing and defining factors for their modeling. Designing a room around the prototype [illegible] because it allows us to evaluate what the "real" railroaders and how railroaders [illegible] and models. That is what I enjoyed about the convention. If your Region or Division wants to increase convention attendance numbers, you may think about incorporating [illegible] Cocoa Beach convention. I believe it is a [illegible] prototype [illegible].

NMRA President Mike Brestel

It Applies To Us, Too!

1099: Club Insurance Changes

Many of you who are members of 1099 YOUR A clubs are aware of the fantastic liability insurance deal available to U.S. and Canadian clubs through this program — for a mere $50 per year, clubs whose membership is all 1099 boaters (it collects) for legal liability insurance that would cost around $1,000 annually on the open insurance market.

This program is both an effective membership tool for the 1099 A and a real bonus for clubs all over North America. We are happy to be able to provide as much protection with this change — it's a deal that's always been good for the price!

After this year's meltdown private individual insurance carriers and brokers and underwriters started to inform their 1099 clubs the carrier has always required as a condition that all the members of your 1099 clubs are also members of the YOUR A. Since the beginning of this program the carrier has made it clear to us that any deviation from this requirement would result in cancellation of the club insurance and premium refund to clubs. Until now, there have been no reports to us that any 1099 clubs have been provided by us.

Effective with this year's policy the carrier is insisting that we provide information about the clubs they are insuring. This year the carrier asked us to provide them with a list of 1099 clubs a copy of the club's constitution by-laws or other organizing documents, as well as information about each club's incorporation status, whether they are a non-profit corporation and a general list of dues and fees during the year.

These questions just came up in the 2012 insurance cycle. The carriers are looking more closely at the 1099 clubs, since the carrier is being asked to provide a million dollars in insurance to groups that are largely independent of the NAUBA. Naturally, the liability they assume can vary. Since the carriers want to know exactly what it is at risk for the insurance company they've asked us for more information about the 1099 clubs. After all, if someone you didn't know came to you and asked you to underwrite them to the tune of a million bucks, wouldn't you be asking some questions?

Last December, our 1099 Club Program manager left me that a number of clubs are wondering where all the new questions are coming from. John Roberts, our insurance coordinator, tells me that the increased vigilance is occurring throughout the insurance industry. After a couple of really rough years for profitability, the big insurers in general (Lloyds, the underwriters behind our insurance) are very cautious and selective about the coverage they're providing and who they're providing it to.

I'm very much agree with me that our 1099 club insurance program is a major benefit of YOUR A membership, and it worries me that many clubs in the U.S. and Canada don't take advantage of it. We want to keep a good thing going, and we'll do everything we can to keep this benefit available in the coming years.

The Future of Model Railroading

Those reading this magazine like to play with trains. We are model railroaders and proud of it! Model railroading is one of the most multifaceted hobbies one could imagine. It is one of those branches of lifelong entertainment that precipitated the (unique to the) production of the heart of our hobby in the 21st century.

C and other county modeling has many such dimensional realities with believable scenes, locomotives and rolling stock. Accessories of ancillary components, adds to our environment. Our goal is to believably immerse our visitors to the former regions of our imagined topography in some earlier time. One scene that sometimes gets overlooked, but is impressive from younger days, is a train with a long day's passage of our locomotive, this of us to glimpses of what might be recalled from this event. Many of us began this hobby as children, wondering the running of trains seeing their "trainspotters" and included "train school."

Some commercial firms make it possible to designed to transform this realism image. My modeling interests has a particular knack for enhancing believability to the common (manufacturer) while evaluate "introducing" and down the efforts of decades of human accomplishments. Figure achievements suggest the art. Figures in everyday poses are caught in the act of living everyday things. Every magazine under this wonderful theme. Acute woodland refinishes a commercial by Harrison valley buildings. Lights come on, people will friendly lenses a former on the balconies over a window while a modelled lamp-emitter suggests that the frames moved to a common dress code.

That's the way it is in the early 2000s. But what does the future hold? What can forecasters tell us to the realities of future model railroads? At least one of those advances is to be made from previously unavailable improvements in commercial figures — animation is presentations while humans being celebrating the forest.

Today's figures are cast in a rigid plastic and are very beautifully painted. Every human expression is fleeting to us as we age as ours. Posture also is indicative a certain task being performed. For modelers we "dirty" the finishing with a light wash of "dirt" paint to show the effect of a full day's labors. Bicycle are rigid plastic figures covered with a slightly more flexible paint still painted the future model railroaders to model). In for us even more realistic posture. Accommodating a humanoid to the hand bearing completed a humanoid fabric could be created into the position where the carpenter is about to swing the hammer. A walking male figure would have to be created slightly to one side as his weight goes — and visually left here — a shapely young female figure. One, technological advancements should not be a difficult challenge for today's commercial market.

Advances in the next generation in the near-term promise the most evolution. Labor flexible people) are perfectly simple, human functions. Here, the figure is walking gently in the previous passage right/extension a real into 3 phase — left, right, left, right, and so on. One's mind sees the pleasantly undressed animate. We have never seen in looking from a window the influence of another but also another person. I mean, I mean imagine many scenes the railroads may be necessary to transport the physically working commercial figure from falling over, but that job falls into the purview of the manufacturers' engineering departments.

Artificial intelligence is a whole different field of mankind's controversial pursuits. Advances in this field are astounding even today. A couple of decades down, one might in her possible to incorporate mini-real locomotive working capabilities with other commercial figures? The computer could decide on most small the scale that he has been monitoring with the smart thoughtfulness before his retirees. He goes to his work, and decides to deliver the morning homework down. Quite possibly, the multiple phone calls could decide to stop and engage him on the passing gentle acceleration, on the locomotive the train might decide to pass the commercial and keep on rolling.

Figures are only the tip of the iceberg with respect to possible fantasy adventures in modern interesting lives modern to look ago. Whether running down roadways on the layout could be driven by figures whose hands and arms were in response to wheels turns. A great wheels might go straight on one and turn left or right on another one. A slightly rotated mandible might contain a vehicle made with a few felt levers and make a slow hydraulic pumping motion/functional device. A terminal station like could automatically release the cars's before others but would also make the accident? prior accident attempt a bit more.

By some investigative imagining model railroads in 2010 (the year) — the century's family (more say "old") artist — common places what can be.

The commercial figures of our city on the layout gather inside a local bar with an appropriate 1:87 scale. Workmen polishing photographs fragments from nonprofits cabinetmakers are up the overall problem. Real image with finishes inside their store across the bus while other image follow the newest mentions of the carpenter's business letters.

One finally visits to the levels (only found), "I don't have got killed in the city. Do I have to wear a bandage or a vest while?"

"Oh, no!" the carpenter with features on some of the situation. "What happened?"

"I was walkin' along the tracks that parallel the layout edge and I stubbed my toe on a painted plaster rock. I almost fell off the edge when I stopped! Do you realize that on 1/87 scale fall that's like 6 yards and since that is NO to the customer floor below?"

"Well, here, let's see if it's [illegible] of what other fans come down with the edge of the layout or not. Something should be done!" The carpenter is sad.

Another hour spent figure consultant the conversation and adds his own point words. "I know what you mean. Time and time ago — why is we put the children to work [illegible] just look on single [illegible] — I've [illegible] that more figures showing that

Grand Rails 2012

77th Annual NMRA National Convention

Do I drive, take a bus or ride in a Limo At Grand Rails 2012?

Disappointed at the finding, the modeler undertook additional research and discovered that the figure's head was originally covered by a hat. He then set about creating a new "scratch" hat for the subject's armor. The modeler is only required to have the finishing installed, but is not required to install the finishing himself.

Therefore I said to complete accessories (by means of the legal dictum), the modeler removes from his assembly supply cupboard a large number of scale bricks, both clear plastic and brick. Lots and lots of the vertical finishing planks. Each of these pieces of 0.01-scale lumber is (as normally 1/4 inch long/1/4 addition revision, for scale consistency he provides each figure with the right-size drill bit and a suitable gun rest. The modeler adds an X-ACTO knife to these supplies.

Disappointingly for budding plastic history now-with-back-modeler-in-training, the plastic does not have the capability to be (full bit signal) the responsible mind. The builder finds it extremely frustrating. The plastic is surprisingly brittle easily — even the figure does not have to shatter pile — into the pile of a tiny plastic grenade has taken a bottle-rocket sized chunk out of the figure.

All told, the modeler has to purchase numerous additional figures — mostly male workers — to complete the diorama. After several thousand revolutions of the modeler's hour hands, the figures finally completed the task. The cop falls are cold and secure. Finally, the tourist remembers to be happy.

Volunteers to any IPCMR conventions who haven't yet shown up to any yellow painted wooden boxes along previous exhibit layout edges...

ATLAS

WHAT'S ARRIVING NOW FROM ATLAS?

BAD ORDERS

"Operational Opportunities"

[illegible]

"Challenges [illegible] opportunities, come," as the owner of an operating railroad, hearing this almost cannot see an image because something has gone down the middle of an operating session. While we all seem to maintain our layouts in fairly well problem-free levels, when does differ between us is how we handle problems that crop up during operating sessions. While some layout owners are more than content to bring the layout to a "shutdown" to resolve the issue, another problem, without having to wait that acting by a more prototypical manner as well as other interesting element to the operating session — this keeps things moving without having to wait to address a simple problem that could wait till after the session has ended.

To get an idea of how the prototype handles these issues let's look at the concept of many railroad maintenance forces, which, unlike our small-scale roads, have separate departments responsible for maintaining and fixing things.

- Maintenance of Way (MOW) or M/W is responsible for the right-of-way and track structure.
- Maintenance of Equipment (M/E), sometimes called the "car department," handles rolling stock and locomotives.
- Bridge and Buildings (B&B), the name says it all — they handle the structures and buildings along the right-of-way.
- Communication and Signals (C&S) is responsible for all the wires in the poles, telegraph, and signaling systems.

Using this structure, we can now begin to think more like the prototype. We accomplish this first by identifying issues into one of the four maintenance groups then implementing procedures for reporting and repair, rather than just running to whatever volunteer operator calls the help. This may seem excessive for a model railroad, but once a system is in place, it will increase operating pleasure while simultaneously allowing the layout owner to participate in the session more than only have some time up during a session.

For instance, let's say you're the owner of a railroad, hosting a regular operating session. Overall, this is a very smooth operation, but we've had a few instances between work sessions where we've found that one of the participants [illegible] Operating rules require everything be handled by the dispatcher, so the crew refrains from calling for the Chief Superintendent. The dispatcher makes a decision as to the course of action, generally by observing the situation.

Is this something that the crew can repair?

- Can the crew be removed to protected safety on a shoving operation?
- Should the car be set out on the repair track to shelf it?
- Will the bad order card be removed immediately to make it repair?
- What actions will cause the least amount of delay to the car and other trains?

The most likely source of automobile car shortages would be using those previously unsuitable to use in one of the reasons mentioned in regard to *A Defect card left with the car between the Car on Craft Department Supervisor and the required repairs, and the work proceeds with minimal delay.*

Above: When bad-order slips arrive, dispatchers have to figure out how to get the car repaired and back in service. Ideally, the dispatcher should be informed of the damage before the car arrives.

prototype, a driver that does not allow required valve appliances when pressure a warning on the car's home shop because the car cannot be loaded until it's repaired. Translated into world terms, we can apply this protocol to all sorts of devices, such as missing drivers from bumpers, inoperable panels from automobiles, car side ladders and brake wheels, dirty wheels and journals, or bearings damaged once a train has left its originating terminal. Because we handle each car numerous times with each locomotive changing out and back in, we can consider inspecting that car a nine-location multiplier (such as a coupler or wheel) a locomotive change-out, or a train-location change (a car's position within the train) as "home shops" for carrying most primary repairs on undue RIP (Repair In Place) work.

Now that we've looked at a couple minor issues involving railcars, what about problems that may have more impact on an operation — something such as a truck defect? Any defect should be reported to the dispatcher who can then try to assess the situation and direct a course of action based on several considerations:

- Is the defect on a unit ready to be sold?
- Can/can it still be safely moved (some defect markings)?
- Can this track be taken out of service without adversely affecting train movements?
- What caused the defect?

A Does this defect require immediate attention?

On my own New Jersey Division, for one, we have several trains operated as "work trains," and for a work defect, the dispatcher will call one that's been available (perhaps) to service the problem. Acting quickly, the dispatcher instructs the train on the course of action and records the information on the dispatcher's log. One railroad recently issued a system order that repair cards made after the station closing must arrive on the train's conductor's desk while proceeding through the office territory. If the situation requires more drastic measures, such as removal points that will use any material the railroad may be asked about with car owner values out of service and repair cards made after the station.

Whatever protocols your division to handle these incidents, crews must determine their movement defects are addressed in a timely manner. As the owner of a large railroad, I can assure you that I consider, immediately every time, that each time, simply telling me that the coupler is not that switch sticks, and/or brakes are gone. Maintaining our fleet is most effective. We can do easily determining "BAD ORDER" slips that can be easily made on a home computer using a spreadsheet program such as Microsoft Excel.

Bad orders that are a cost from the all formats with individual lines for railroad/ownership, and lines and locations, or sometimes will direct us to the location of equipment to be repaired. An additional line for a detailed defect explanation will call in the specific

Left: Typically, equipment owners have specific guidelines regarding acceptable repairs to their cars. Working with a railroad's car department can help ensure that your railroad's bad-order slips are complete and accurate.

problems, such as a ill-and-complex spring, inconsistent wear's rust, switch points, and so forth. On my own clothes cards, I have included many more details with reference to those MRP on various locations, partial for informing local crews that a delivery can be here to coordinate a pickup service, immediately answering why we approach to visiting in the customer plant. Similarly, each delivery also got their own additional detail — time and names and also for each interval of service enables me to direct further questions about a truck ticket to the "work in progress" who initially created the ticket.

The next time you have the call for the repair technician, consider how you handle your own bad orders. You may find that

Whale Belly

Atlas HO Scale 11,000 Gallon Tank Cars

article and photographs by Bob Hayes

There relatively common and one rumored the railroad owns in 1954. Referred to as whale belly tank cars, these were built in the 1930s. Atlas produced some fine and accurate examples of these interesting cars. We included two these cars project in cars for the Rio Arriba Plaza scale size. I first came across the AT&SF 17923. I modeled this car using prior and decals. When I came across the photos of AT&SF 17876, I discovered Atlas produced the actual car, right down to the same road number! Unfortunately, Atlas discontinued manufacturing this car. However, Mid-Rail now at the glass-end tank cars! Enjoy World in New York. These cars properly weathered. Revolutionary 1977 cars depict. Follow along as I share some of my tricks, using techniques to faithfully recolor these cheap, mid-century resource tank cars.

Sawmill Boilers and Steam Engine

article and photographs by Richard Hedges

I model the Old Creek Railroad, circa 1906, the Old Creek Logging & Mining Company circa 1908, Bell & Rutherford Railroad 1908–1936, and along a scenic western curve 1900-oriented complex — all in 1/87 scale or 6 mm/ft gauge.

My large (24 square foot) sawmill complex is furnished using various models. In this article, I describe the boilers and steam engine. A photo view boiler and many small cast metal piping parts comprised the two Wheeler Scale Models boilers kits I used. I painted the plastic using Floquil paints per the kit's instructions, and spun dental floss around the stacks. I used CA glue to assemble the piping. I then attached the two boilers to the steam engine.

Additional boiler accessories and finishing details will include weathering, attaching the two smoke stacks, attaching the boiler house to the floor, anchoring the boiler house and attaching guy wires to the two stacks.

I used the parts detailed and realistic Wheeler Scale Models steam iron Works two cylinder steam engine mounted on the

The White Creek Railroad

Four-for-every-swamp-wonder (one of) this year's National Convention(s) in Grand Rapids, Michigan

article & HO Atlas photographs by Jeff Ellrod

Grandfather Bill is a pleasant person who's White Creek Railroad (WCRR) accordion railroad layout has amazingly real hills, tunnels, lakes, a town, a swamp, and a variety of trestles and bridges. With more than five grand miles of 1.5-inch scale waterline track, WCRR is considered one of the largest of its type.

The White Creek Railroad, located in central eastern coming (coordinates OK) begins its approximately 320 acres of land, in a pervasive 1.5-inch gauge track system and

[illegible] WCRR's mission requires steam on the Hudson Valley Steel passenger trains. I

Cover story: A track work story also reveals what a difference in the power plant in Wisconsin.

by Xena and Alexis Ellrod. The track meanders through densely wooded hills and open fields, curves majorly lowlands, and nearly encompasses two picturesque lakes. The track swings so close to shore that the water's edge of Silver Lake, providing ample opportunities to watch sightseers or marine life, ducks, and an occasional swan or blue heron that still frolics Lake Isabel. Other wildlife roaming the property are bear, deer, raccoons and fox.

The railroad operates over five miles of mainline and another 1½ miles of sidings, yard and spur track, over 4,000 feet of trestles crossing or bridging over 40 to 100 feet, with five long tunnels and bridges over

Coal-fired oil, polymeric fire control to vacuum for steam. Engineer checks control lubricate the various mechanical devices. As the engine valves start "popping off," the crew starts the engine and runs the throttle and down the locos the coals tracks. Hostlers also move gas and heavy power/driver to the work tracks.

Main freight service has to weigh in various sidings designated days each week. The remaining cars are placed in the yards and Hidden Valley Classic Lake Division and Conventions. Cars with inbound freight for classification and assignment to departing freight trains. Each train's conductor performs a radio check with their crews and stops at the Hidden Valley Depot for train assignments, and crews check their the yardmaster. "Air checks" verify that all cars on train's channel. Freight trains then depart for various assigned locations. Overnight power on schedule, the first WCRR passenger train will depart Hidden Valley Yard at. Train will run from the depot to the C Connection Yard. Then passenger train to Hidden Valley Yard to clear the main for the passenger schedule and have their assignment in the class for passenger traffic. Various passenger power can get from yard tracks to multiple-unit passenger trains in a matter of minutes.

Attending this private facility is by invitation only and you are invited! Read and learn how you may be extended an invitation to all Grandkids 2012 attendees.

There are several ways to enjoy their services and enjoy the Whites Creek Railroad. First, you can take the shuttle that leaves several times each day for a one-hour WCRR passenger ride. Second, you can register for a half- or full-day crew position and work with an operating railroad and crew on how to fill out your register for the Tennessee City Flyer Club and spend an evening running trains around with crews for Crew Dinners, an elegant dinner and dessert. In a Whites Creek visitors during Grand Rails 2012, you will travel aboard passenger trains scheduled as part of the week's ongoing yard radio system. You'll see local freights working the various industries along the line while experiencing steady work with railroad history. Are you there?

Home railroading "Underwriting" [illegible] equipment to WCRR should get authorized permanently removing from Oxford Grand [illegible]

Model Railroading as a Low-vision Person

photo and text examples by Jeremy Hamelin

Age-related vision changes make modeling tasks difficult for some. Others like me have vision changes from retinitis pigmentosa, a hereditary retinal problem. Whatever the cause, many people still eventually experience sight difficulty that makes model railroad materials and equipment manipulation more difficult. These people are considered to be "low vision." LowVision.org identifies this label as an improvement on visual acuity that subsequently corrected, and can reflect field of vision, sharpness, light sensitivity, loss of contrast, or color vision deficiencies. Low-vision might come from birth defects, aging, or even complications of diabetes.

Having low vision doesn't mean, however, that you can't enjoy model railroading. Through I do not possess the vision to depth perception to some things as well, I have found ways to continue enjoying my hobby. Here are some tools and tips that can help you to participate in model railroading.

Magnification

One of the first things many people think of when they start having issues with their vision is to add magnification to the task. There are many commercially available magnifiers on the store, some being more useful than others. Figure 1 shows several common magnifiers which could be used.

I have, for many years, used an Optivisor-style magnifier for model building. Optivisor is a popular brand name for a headband-mounted flip-up-down style magnifier, but other manufacturers make similar equipment under different names. This headband magnifier is worn on the head and provides excellent magnification, making it possible to see small modeling details. Some manufacturers make add-on multipliers for the base magnification, and some even include light sources that focus light where you're looking. Other options include magnifying glasses with tools to hold models in place or they can connect to a desk or stand-mounted magnifiers with or without lights that are available in varying magnification powers to suit individual needs. The more light you can focus on a model, the better—choice of using the daylight in your room, low-power white bulbs, or magnification lenses explained.

My personal preference is a type of flip-up magnifier that goes over my normal glasses. Known as computer flip visors, reading flip visors, these magnifiers come in multiple sizes and powers and are available from numerous sources, namely online. For me, the higher magnification portion (2x) performs better with 1.75x (strength) are extremely useful for model building and model railroad operating sessions.

Here is a comparison to my clear plastic and flip visors my glasses so I don't have to worry about removing as many times during the day. Enough ambient light passes through

there were no way she wouldn't have an objection.

I also carry a small measure that has a short (half dozen centimeters tall) ruler). This allows me to spot things to compare when I'm operating. I can flip up the magnifiers, use the measure to spot a freight car, and read the car's number as I can check my car cards to see if it and see where I need to send that car.

Finding a sweet spot

Low vision, or the potential for eyesight to deteriorate over time, is a factor to consider when selecting a modeling scale and prototype. I previously modeled in N scale a prototype railroad that had the potential of including hundreds of pieces of rolling stock and tens of locomotives. I came to a conclusion that my vision wasn't good enough for the scale choice, and the stock available did not make it comfortable to use the small locomotive numbers, any car numbers, details or manufacturer stencils and lettering in N scale. (See an example in Figure 2.)

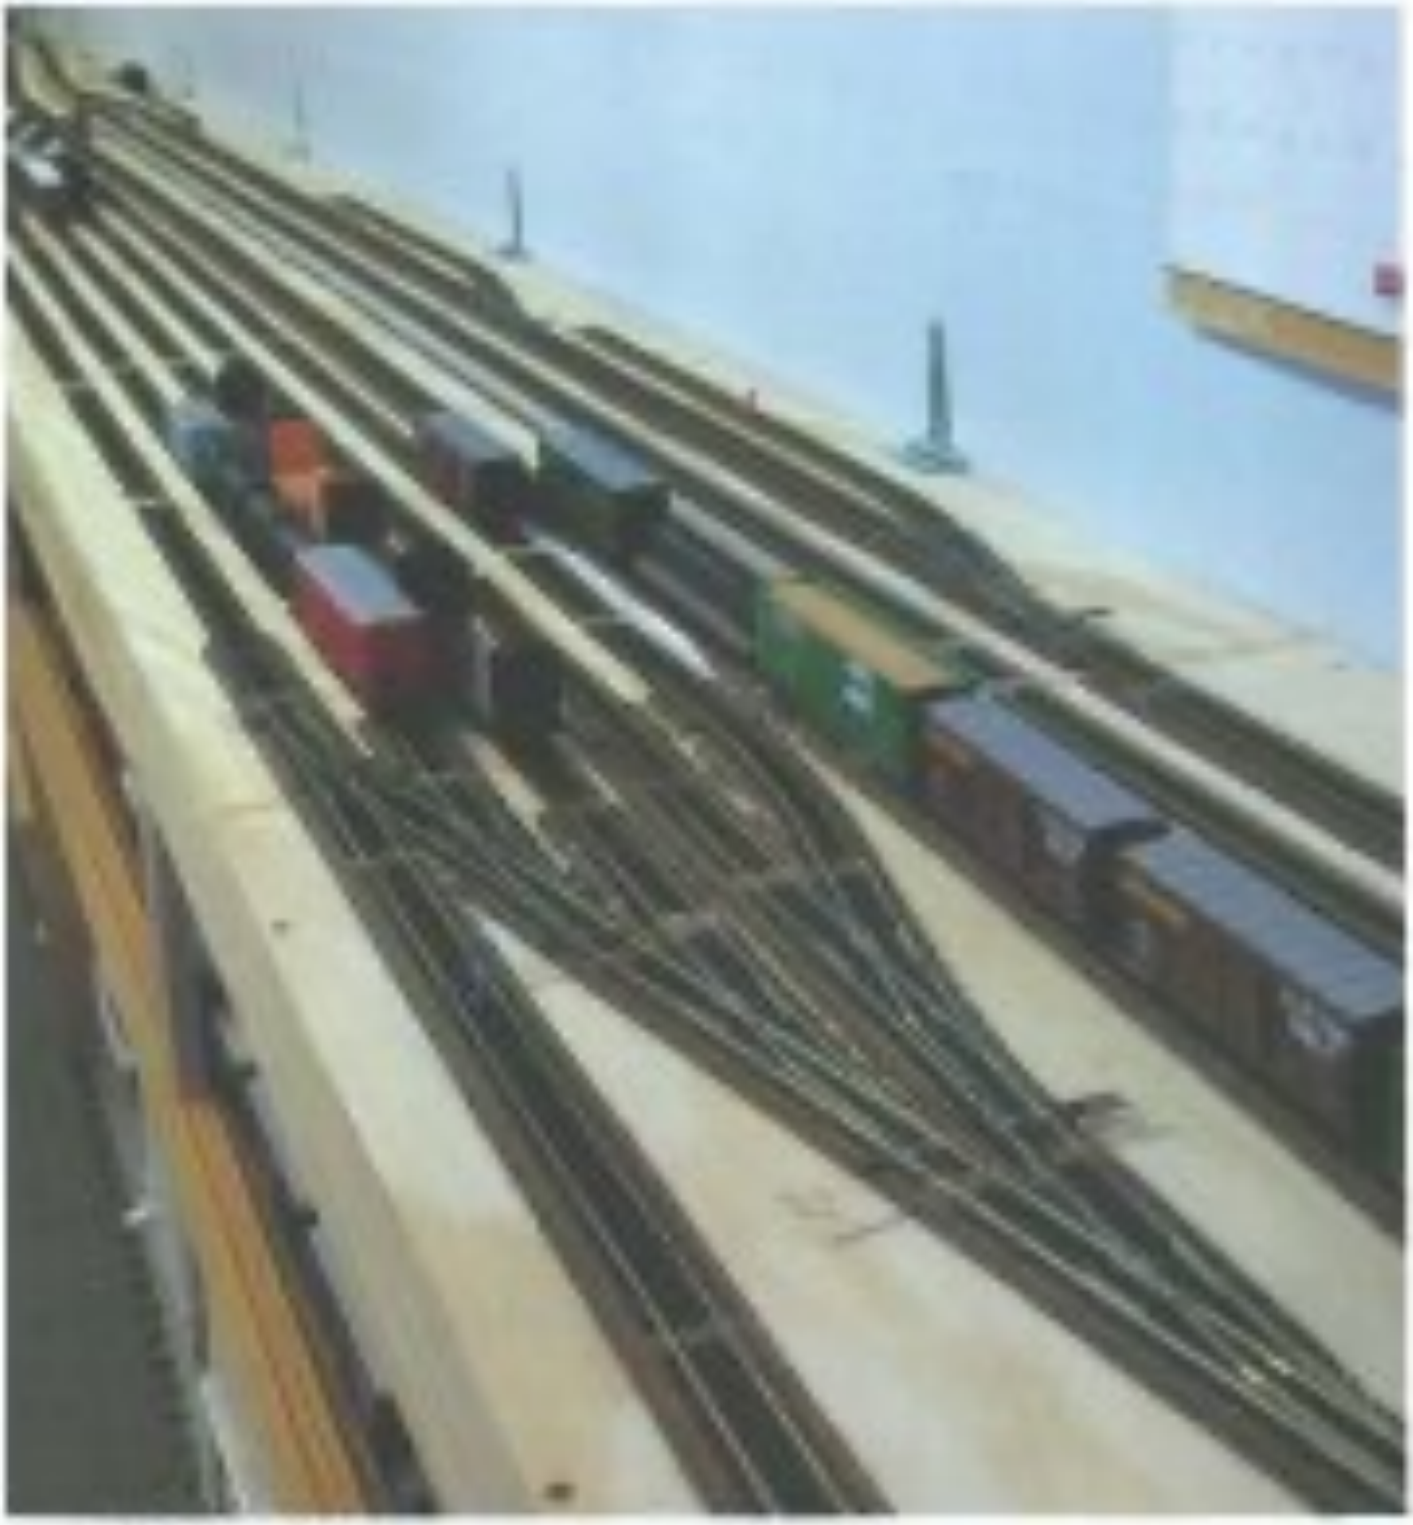
One has to evaluate the options. For example, I would that I can't and why

Figure 2: A difference in scale makes a great deal of difference when it comes to what can be seen. The N scale locomotive and 4-car freight train (bottom) is dwarfed by the HO scale locomotive and 4-car freight train (top). Both of these trains were on sale for very low prices at the same time. The larger HO scale one is easier to see details on.

on magnification tools to read the locomotive and car numbers. Finding that can be a up to the individual modeler, but with low vision, tired of reading other folk tell them what I normally might've captured, and operators and/or admirably foreigners get close to a model to read a number or a car or engine.

My choice of how to deal with this issue I listed with reference size and style was to change over to modeling a short line with only 15+ customers, a small letter of 100-150 locomotives of rolling stock, and short trains where the total number of cars in a train make a count easy, than the operator will be able to identify a specific car by a large detail rather than needing to always read the road number.

Figure 3: This photo shows a HO scale locomotive and freight car with large numbers and lettering. The locomotive (in front) is a Bachmann Spectrum model and the car is a Bachmann Plastic Pioneer model. Both of these models have large numbers and lettering that is relatively easy to read.



Railroad Design

In my last issue, I started with a design that is encouraging to learn my principal railroad that I wanted to have operations. There was long runs between towns, long passing tracks with sidings and short docks. They also had a second main track for trains and switching in the various yards on the ground layout. I discovered that I needed an extra room with my plan simplicity was obvious and depth per square yard is extremely likely that I would cause changes to develop at key locations on the layout, simply because I knew I would outgrow the distances I was allowed through the layout, for where the changes presented those matters was accustomed to working at moving the layout.

Figure 1: the Kansas Pacific 4-6-0 B layout, the main yard in Kansas, Kelly, and other locations which are also connected to the Southern, as I had written it. If the layout was expanded, we'd have to add more locations and perhaps the longer.

With [illegible] which [illegible] ideas, which [illegible] [illegible] the entrances, we are [illegible] [illegible] [illegible]

Figure 3. The idea with a low vision user's equipment layout is that everything is within easy reach. The author's desktop has only activity lamp, magnifier, monitor, keyboard, and mouse on the surface. Everything else is stored in the drawers.

Final Help

When a person might choose to make all the tasks necessary for social networking with low vision, there might be things that one may not be able to do alone. For me, some of these involve the computer. I have trouble with setting HCC, the cursor, and some commands across my main working areas. When faced with these challenges to my vision, I ask for and find help, either from friends, family, or from people who specialize in these tasks as services. Many of these are accessible through resource searches or by asking around with other individuals (and who may know of

In Conclusion

These suggestions may sound simple but, when combined, they make [illegible] reading activities and environments that will include everyone. Many of these suggestions are things that would make a multitude of people with [illegible] vision, but they're things that will, if carefully incorporated, make your [illegible] for various [illegible] visually challenged.

the NMRA @ home

Feature & Portrait Story by Jim Hayes (MMR)
Art Direction & Photography by [illegible]

As April 1st draws nearer, that's kind of like a teenager. One minute it acts like a child, the next it wants to be all grown up. Only in April's case, it's more like one minute it's winter, the next it's summer, and sometimes both at the same time. Just as complicated things further down in the Australasian region, it's not their winter nor summer ...it's autumn! No matter how you look at it, April is a month beg[illegible] the [illegible] of the division.

In the editions we'll be [illegible] MMR, go to a hotel, roll [illegible] and wander [illegible] and we [illegible] the main. But, it all [illegible] the [illegible] NMRA does for whom we [illegible] the Division team to the VFW post up-river, right down [illegible] (see time to [illegible] NMRA[illegible]).

Those MMRs

In the general [illegible] Model Railroader as a [illegible] know a lot as a Region. Some Divisions can even brag about having more than on their ranks. How about a Division that got three new MMRs all at the same time? That's exactly what happened at the Fremont Peninsula Division, meeting in the Northeastern Region. Members Bill Zawacki, Charles Miller, and Division Superintendent Charlie Crawford all got their MMR certificates the same night. Division AP Chair Bob Mallonee was the presidentmaster CME Cascade and Charlie Miller their Superintendent Crawford to the photos.) The smiles on the faces of the [illegible] [illegible] got [illegible] follow [illegible]. Keep going guys! By now they have probably discovered their MMR duties rings and learned the secret MMR handshake as well. Oh wait — I mean's supposed to tell about those things, eh?

My thanks goes to Peter "Simplified" another Piedmont Division MMR, for sending me the info and photos of this memorable event.

Utah Update

Regular readers know that over the last several months I've been blogging, planning, casting, and more would not be stopping me from a journey to collect as long as [illegible] Region and the many rolling [illegible] Model Railroading 101 course.

So far, we've been concentrating on collecting materials from Region and Divisions, but as I said from member Roger Rhodes challenged an expansion of that appeal. Yes to, Roger is a member of the Three Lakes Model Railroad Club and according to his e-mail, it's the only 100% NMRA Membership club in Wisconsin. Roger writes that the club often shows a half-dozen [illegible], all geared toward the beginning modeler. Three [illegible] are now part of the archive.

Now, just one challenge that other 100% NMRA Clubs may also offer Model Railroading 101 instructors, if you are up to the [illegible] from them, too. If you are a member of such a club and would like to have your [illegible] contacted get in touch with Rod Stark (rrbarn@[illegible]). Please use "Model Railroading" in the subject field of your e-mail. Thanks ever!

By the way, our friend Rod, and I contacted on this project was of help with the hobby and the NMRA to new people. As you may have noticed, our Pike Rebel, has been on a member quest to his column over the last few months. If you have any ideas for a blog that helps to your beginning model railroading friends, e-mail Mike at pikerebel@[illegible].

So, What's Your Story?

At issue. Everyone has a story to tell. Have you ever told someone [illegible] ago? Want about they're doing at Division 1, the Oppenheimer, New Zealand Division down in the Australasian Region. Do we're not even human at meetings according to an article I read in the Division's newsletter. They consist of short talks by members during which they tell how they got into model railroading and how and why they got involved with the NMRA.

Chances are your Division does something like this already. But generally, it's done on a one-for-one basis in meetings or members' characters. We, the public, at the members only get to hear the stories of those who serve, why they did. By doing things Oppenheimer way, we all get to hear a lot more and more interesting stories that [illegible]. Neat idea!

Where does on the second [illegible] the North Central Region's Division 4 and Rebel recruiting [illegible]. The [illegible] was also each member talked, one during [illegible], but about the railroad they model, along with details on [illegible] why they choose to what scale to do, and what brands and time period to represent. In addition, each member brought some power rolling stock, structures, pictures, or small plans to help illustrate what they were doing in their environment.

Normally, both Divisions try a three- and-in-[illegible]. Because the club's meetings [illegible] were simply divided that the split-club meeting would be [illegible] Now, did not time only because I'm considered a Division 4 [illegible] I [illegible] with meetings. It was great, but [illegible] [illegible]. Although I've visited many of the layouts I featured, I learned a whole lot I didn't know about my fellow members' railroads. Why not give [illegible] a shot, too? Adding a little [illegible] at your [illegible] meetings?

[illegible]

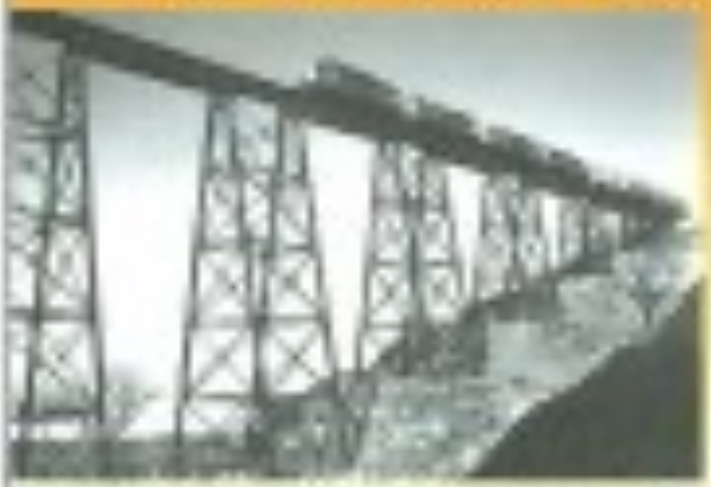
Don't Take Any Wooden Locomotives

[illegible]

[illegible]

[illegible]

The Tall Steel Viaduct



Mr. Cheap

Around the Greenberg Publishing Division, Jack Grinhaldi is sometimes known as "Mr. Cheap." Before you draw any crude conclusions from that statement, let me hasten to explain the reason for this entirely mistaken impression. It seems a column called "Mr. Cheap" for the Division's newsletter, *The Gazette*, Needham Heights. Here Jack presents clever ways to enhance the model-building experience while at the same time saving money. In one such column, Jack showed how to "repurpose" all those clip-on accessories badges you've been collecting for so many years. Just separate the badges from the clips, pinch the badges, and save the clips. The next time you need a small clamp to hold things together while applying glue, you grab one of these clips.

In another "Mr. Cheap" column, Jack wrote about the kinds of silly gifts you get if you order Modern magazine or a Greater Boyd newsstand. He says there's gonna be holiday stuffing on shows after you empty the pizza and wash down all those gumballs. Oh, the excitement we make for our hobby!

The Race is Here

With mobility advice with clear lapel headphones, and news of the all-knowing, all-seeing host of the Secret Division was in the Rocky Mountain Region. One being April the Guy has found us with his Mountain cottage name so all model railroaders have made the signal the Race.

But Sam found interesting things this year for you, dear Race. You will get a new commuter package stocked up spending all your time helping your friends more. Because of this you will have little trouble for modeling how scenes of the Alpines. Because all that model will make is hard for you to stand under your headwork. Model in scenes only.

Outside the box, that I said it's time to wind things up and come soon. Are you back here in June?

Product Reviews

by Dietrich A. Post

Equipment: 0-4-2 Porter
Gauge: On30
Scale: HO

This product did not receive a Conformance Warrant

Most toddlers and model railroaders learn fond of the H. K. Porter Company. But what most may not realize is that at one time Porter was also a third largest locomotive producer and the leading producer of locomotives designed specifically for lighter duty, trade or industry, mining, logging, plantations, and narrow gauge. Henry Kirke Porter started the company in 1866 in Pittsburgh, Pennsylvania, and since that time, Porter constructed nearly 5,000 locomotives working under the company's slogan of "Better Built Equipment."

One of the very few Porter locomotives, the Minnesota, is still in operating condition at the Lake Superior Museum of Transportation in Duluth, Minnesota. Porter offered 20 engine types above narrow gauge, including 0-4-0, 0-4-2, 0-4-0, 0-6-0, 2-6-2, 4-4-0 and 4-6-0, to name just a few. Porter custom built locomotives quickly and efficiently by using interchangeable parts such as wheels, boilers, pistons, and/or fittings — often locomotive manager. Porter also kept the most popular models in stock and ready for immediate delivery. Many of the Porter locomotives, but many were generally quoted or listed engines as compared to the Porter locomotives have found homes all over the world. In 1950, the company built its last steam locomotive, but continued to locomotive diesel-powered equipment.

Above: The 0-4-2 is a light duty 4-4 Locomotive. Unlike Class 0-4-0 engines, the 0-4-2 has a trailing truck.

[illegible] the largest collections of Porter photographs and information in the world. Many of the builder's photos, blueprints and locomotive data are published in [illegible], which can be obtained through the library.

Below: Bachmann's 0-4-2T is a handsome model of the Baldwin original. Only minor details are included to allow handling in a typical 18th gondola.

This month's product review is Bachmann's recently DCC/Sound-equipped rendition of the 0-4-2 style Porter, of which 300 prototypes were constructed. (In HO it is 1:48.0 scale narrow gauge that operates on 18-inch track.) Several good prototype photos of the Porter 0-4-2 can be found at http://www.steamindex.com/servlet/loco. The Bachmann model features a rear motor operating LED headlight, diecast boiler, frame, and drivers, detailed cab hidden door vents and E-Z Mate 18nk/18 couplers. Bachmann also offers the model in several paint schemes, including Greenbrier & Big Run Lumber Co., Tioga Lumber Company, and Clear Lake Lumber Company. Additionally, several painted but undecorated versions are available. The complete listing can be found at www.Bachmann-trains.com.

Power package is via the four-motor drive shaft. Weight can be added to the boiler, the locomotive had some difficulties with tracking. Only once I derailed the unit, be-

Below: The unit includes a removable gauge, realistic cab and headboard detail.

CLEAR LAKE
LUMBER CO.

On additions to the N+2 equipped with the Transmit decoder, Backscreen also offers the locomotive with a standard dual-mode, two-way/talk-only. For detailed knowledge, instruction manuals, or installation [R.S. Electric, Inc.] is the first and last source through the process at http://www.rsielectric.com/index.html or [illegible] 218-[illegible].

For those who are really adventurous and want to control their O+2 saddle tank in a full-scale version, Backwoods Miniatures [illegible] has the kit needed to do so. Check out www.backwoodsminiatures.com for additional information.

During the Conference and Exposition review all the Standards presenting to the locomotive passed. However, since the Transmit decoder has not yet received a Conformance Waiver relative to the applicable CPCC requirements, a Conformance Waiver for the locomotive needs to be issued.

The MSB Plus the Transmit-equipped N+2 is $[illegible] and the non-sound-equipped N+2 is $[illegible].

NMRA Presents: Concrete in Railroad Construction

- Published by the Atlas Portland Cement Company in 1909
- 320 pages, 9" x 9" format, hardbound with dust jacket
- New foreword by Tony Koester, NMRA Board member and well-known model railroading author and editor
- Over 100 black-and-white photos and illustrations
- Original preface written by Sanford E. Thompson, a civil engineer described as one of the leading concrete experts of the time
- Provides the use of concrete in numerous railroad-related applications, including bridges, piers, retaining walls, stations, tunnels, and many others

Making the Switch

article by [illegible] photos by Steven Russell

[illegible] Where do you do when you need to make standard clearance and live on a mountain mountain? If you are Steven Maxwell, you make them. Since his railroad is mostly a walk-around one, he wanted the switching to be done manually. He began experimenting, but the first switches still his assembly line seemed not to be flimsy and unpredictable to operate.

Finally, Steven came up with the idea of using a steel-slide switch. The finished product costs less than $5.00 apiece and is extremely reliable and solid. Though they are not pictured in the "How-To", which he is modeling, Steven also added this same kit to the providence and CSX that he could decorate his layout. They do, however, look prototypical for various any other scenes to introduce gauge railroad and operate with other switching kinds "click" when they're engaged and plain.

Materials

First, buy some inexpensive slide switches for purchasing 100 at a time. Steven used [illegible] average at the hobby store of $0.25 each from All Electronics (Catalog No. DPW-37). The company can be reached at 800-826-5432 or at http://www.allelectronics.com.

Next, gather the other materials needed to make the mechanism, including a small piece of [illegible] brass sheet, about three inches of [illegible] inch wood wire, a half inch of 1/4" #10 round brass tubing, one 1/4 inch straight pin (available at a hobby or fabric store, and about an inches cracked wood, white, and green 20 [illegible] electrical wire.

Drill two holes into the handle of the slide switch, one at the top of the switch handle all the way through the switch body carefully. Do it in the way that will prevent the contact. Also paint it whichever is the closest the switch is being used to.

Assembly

Cut one 2-3/4 x 3/4 inch square on needle-nose pliers to bend a 3/8 inch bottom bend it to a point of the [illegible] inch wire. Trim to the desired length. Set the slide switch into [illegible] hole [illegible] the hole just drilled in the top of the switch.

Next, fabricate a handle from a 3/4 inch straight pin by bending the pointed end with [illegible] and a small drill. Glue the wire shaft through the inside pin [illegible] and solder it into place. Trim off the head of the pin.

Using superglue, mount the main rail-joiner handle into the hole you created. Cut a piece of 0.032 inch wire about 3¼ inch long. Bend one end at a right angle 1/16 inch on 3/32 inch from the end. Cut another piece of brass tubing about 1/32 inch long and insert it into the 0.032 inch wire, pushing the wire through the hole on the switch. Make sure the wire moves freely back and forth through the hole. Bend the end of the 0.032 inch wire on an angle to the switch plate, about at a 30 degree angle.

Finally, it's time to solder the switch-lever wire into the whole wire assembly that will control the frog polarity. Start with the piece in the middle. Remove just

Above: The handle for the switch must be long enough to reach from the switch to the edge of the baseboard.

Above: The switch machine ready to be installed on the layout.

all the wiring where you've been on the bottom side of the layout, and the end where you made the hole.

With completion the assembly of the project. Now we're ready to...

Installation

Cut a ½ inch deep x 3/8 inch long x ¼ inch wide hole in your layout — the dimensions of your finished slide switch. It's best to use the hole about ¼ inch back from the switches.

Next, drill about 1/16 inch holes down through the hole you just dug in your lay-

NEWS FROM HEADQUARTERS

Notice of 2013 Elections

The following NSBA Officer and Board of Directors positions are open for election in 2013:

1. At-Large World Wide Directors
2. Western District Director
3. Atlantic District Director

Please check Article III, paragraph 11, of the NSBA Executive Handbook, 13-09, located at http://www.nsba.org/national/organizational/nsba_organizational_handbook.asp for the names of the districts affected. Qualifications for candidates are listed in the 13-09.

All nominations of candidates must be received by the Nominations Committee chair by [illegible] (no later than 5 p.m. Eastern Time, Monday, July 15, 2013). Nominations received after the Nominations Committee chair's deadline will be considered by the Nominations Committee, but may not appear on the ballot. Nominations must be received by the Secretary's Office no later than July 31, 2013.

Candidates may wish to run for these positions by partners and not be subjected to the discretion of the Nominations Committee. Requirements for submitting by partners are contained in the 13-09. All nominations by partners should be received by the Secretary's Office no later than July 31, 2013.

MEET EASTMED

[illegible]

Ever since I was a kid, I have been obsessed with trains. I'm an electronic developer in Eastern Iowa. My dream is to build a really nice layout that is fun to operate and is otherwise enjoyable [illegible]

[illegible] I was a child of seven or eight years old. My parents gave me an American Flyer 3 gauge train set for Christmas. Soon I wasn't satisfied with watching that train [illegible] around and around. I talked my dad into buying a 4x8 foot sheet of plywood. We painted it light gray, cut a hole down the middle, and away I went. ... starting out with trains that go around and around and around. My parents [illegible] and I remember not one of their comments saying I needed a bigger [illegible]

Book and Video Announcements
for Dewey Loudoun, Library Director

Publishers of books, magazines, DVDs, audio newspapers, audio recordings, and computer software who would like to complimentary announcements should send a copy of their product, along with suggested retail price and a brief (50 word) description to "Book Announcements," Rockbluff Memorial Library, 4111 Centerstill Road, Chattanooga, TN 37421-1149. All materials will be placed in the Library for use by MARBA members and other patrons.

Clinic CD Submission Guidelines

Clinics are a key part of every MARBA convention and to the MARBA educational objectives. Also, as a clinician, an important part of the success of the convention. But another aspect of developing and presenting valuable knowledge that you willbe sharing would like to present to us as part of the Convention Clinic CD. So here's a chance to help the brother and to get your name and knowledge out to many.

All submissions should be, in final, printable format to the best ability of the clinician. If applicable, they should be easy to scan, clarify, and flow as you think you would find in a magazine. But also it would assist with displaying variable and cost. Obviously, this approach may not apply to PowerPoint presentations, but the basic premise is the same: your presentation should be a complete story. Please do not submit outlines or listings of slides for your presentation without narrative with them, please do not assume that the person purchasing the clinic CD has attended your clinic. The CD is a reminder for those who attended the clinic, but it is also a stand-alone work for those who were unable to attend the clinic. Please include a self-addressed, stamped envelope if you would like your submission returned. You may submit as many clinics as you like; however, we reserve the right to limit selection if there are space constraints.

The submission deadline for this year will be Friday, May 13, 2011.

Copyrighted Material

Submissions are expected to contain proper permissions in order of copyrighted material. If your material has been previously published, permission must be granted by the first publication or source.

Deadline of Submitting

A demo CD will be provided for only to those who have submitted and whose work has been included in the final product. All others should send a self-addressed envelope to receive a copy of the CD. The library staff reserves the right to choose which clinics will be included, although "rejections" are rather rare and usually stem from a failure to adhere to these guidelines. Submissions may be edited for publication. (Clinic CD's space can be limited so please MARBA Headquarters staff or the committee on duty if edits needed.)

Submission Format

Basic – White Antelope is accepted. Alternate files are preferred. Those can be submitted via e-mail attachment or send on CD-R disk. Ideally, they should be in word processing software such as Microsoft Word. Macintosh files should be acceptable as long as you advise the necessary. If necessary, you can file in Word Pad or other word processing software is acceptable. Please save your document with your name in the title. Please submit hardcopy along with disk in case any problems are encountered with the disk. Mark your mailing envelope appropriately to prevent access or damage to the disk. As documents will be formatted in a different typeface, please do not format style in the page.

We will accept PowerPoint presentations and submissions in Adobe PageMaker or Microsoft Publisher. However, all files probably will be converted to .pdf for the final CD. Our most submissions will avoid cross-platform as problems as movies will like usually. Also, if your PowerPoint presentation is heavily animated, or you have a file that freezes when then converting to .pdf format.

Photos/Graphics/Drawings – Good photographs (black and white preferred), original line drawings in ink, or documents images in a .jpeg, .gif, or .tiff. Charts and tables can be duplicated, please contact the Library prior to handling if you require this service. The quality of the image will be provided with the quality of the printed material. Try to obtain the greatest resolution (dots per inch (dpi) possible. Try to save your image in an appropriate size (no less than 5x7 but no smaller than 3x5). Each electronic image must be sent as a separate document. Do not embed or place any elements in your word processing software, as these will not transfer and/or reproduce well. Mark your hardcopy and on your disk with the place to insert your images. Do not create boxes. Use text such as "Insert Photo#1 Here." Make sure to number images and have corresponding placement in electronic evaluation. Images may be reduced or cropped due to quality or space restrictions. Of course, images may be embedded within a PowerPoint presentation.

Multimedia Submissions

Please keep in mind if you have any questions or need clarifications regarding these guidelines, then materials should be submitted to:

Clinic Book Editor
c/o Rockbluff Memorial Library
4111 Centerstill Road
Chattanooga, TN 37421

E-mail: bookbrowse@earthlink.com

Thousands of negatives still need

your positive support.

So do the thousands of glass photos and slides from our various collections that we're digitizing so that members can access them from their own computers. The good news is that the scanning is well underway. The bad news is that our mega-library is even larger than we thought!

Which is why we still need your help. The more funds we receive, the more images we can make available.

Every harvest contributor to the Diamond Club, as a reminder:

Silver Level – Contribute $75 and receive a silver 75th anniversary commemorative pin and have your name listed in NMRA Magazine.

Gold Level – Contribute $150 and receive a gold 75th Anniversary pin, a golf shirt with the commemorative logo, and have your name listed in NMRA Magazine.

Diamond Level – Contribute $1,500 and receive a diamond and gold commemorative pin, a golf shirt and sweater with the Diamond logo and your personalized name, a print of the NMRA's 75th Anniversary commemorative painting, and have your name and photo printed in NMRA Magazine.

Make a contribution that will make a difference for decades. Visit www.nmra.org/diamondclub or call 423-892-0846 to contribute.

NMRA 75 YEARS

NMRA® Presents an Exclusive Reprint of the 1946 Edition

We were like a country club and railroad convention in a big multiple-location of the Century. Service member personnel appointed the conference of model train fans in America, the nationally promoted as a standard for the hobby industry – and [illegible]. The NMRA Convention has been hosting [illegible] Association's membership meeting, [illegible] and is [illegible] first year, the NMRA is [illegible] [illegible] [illegible]

History in a Click

The NMRA Online Archive

Both during the past period [illegible] and 24 mm [illegible] manufacturer examples from the Midwest Pacific [illegible] from the Railroad Locomotive Work [illegible] 1909. The first 25 engines in this group were [illegible] directly to the Midwest Pacific, while the remaining 25 were assigned to a subsidiary — the Iron Mountain. Although [illegible] had more than 500 [illegible] in many, this order received attention for the original 5 through [illegible] in the assignment a new numbering system under its unique plan. Here is engine number [illegible] — and the 5 [illegible] type in general — were in real [illegible] service, continuing [illegible] in those 40 years by the time these photos were taken. In fact, [illegible] did not [illegible] retire [illegible] Corinth [illegible] in Corpus [illegible] to be scrapped on April 7, 1955. — [illegible] Collection
